Omnitron Website Redesign Proposal

Summary

Omnitron's website needs a redesign inspired by the Databricks look, with content curated against its four competitors and one contact form page in place of the live website agent, as the project lead directed.

The discovery questionnaire asks for a visual-first site that does not look like a traditional SaaS website. The current site is fast on desktop (homepage Lighthouse Performance 99) but slows on mobile (homepage 76, with the main headline taking 4.1 s to appear under simulated mid-range conditions), so richer visuals will need a performance budget.

The questionnaire sets two goals: build credibility and trust, and attract enterprise clients. No proof assets exist yet (no case studies, client logos, or testimonials), while each of the five benchmarked sites shows proof or credentials on its homepage. The redesign therefore reserves slots for proof and explains Omnitron's concepts in plain language.

This proposal audits the current site, benchmarks Databricks and the four competitors, applies peer-reviewed research from 2021 to present, and tests a prototype (homepage, the two business-area sections, and the contact form page) with real users. Success means better look-and-feel and usability ratings than the old site (SUS 75 or higher) and mobile performance of 90 or higher on every page.

Background and Problem Statement

Background.

Omnitron (www.omnitron.tech) presents itself as a company that builds autonomous systems for running a business. For a technology company, the website is the first proof of competence: visitors judge credibility within the first few seconds (Lindgaard et al., 2006), and many first visits happen on a phone. A site that loads slowly or looks inconsistent undermines the message before anyone reads it.

Problem.

The website works well on desktop but is noticeably slower and less smooth on mobile, and this is true across all of its pages. Pages take longer to appear and respond, which can frustrate visitors before they read anything. Some parts of the site, such as the social media links, are hard to use for people who rely on assistive tools, and they do not lead to the company's actual profiles. On desktop, the site also has design inconsistencies in its layout and readability. Together, these make the website feel less polished and less professional than the company it represents. The client also wants a visual-first look that does not resemble a traditional SaaS website, and the site shows no proof of results yet.

Who is affected.

The main buyers are SME owners and managers, with enterprise teams as the group Omnitron wants to attract. They browse on phones and laptops, compare several companies, and quickly decide which ones to trust. If they find the site slow, hard to use, or visually inconsistent, they may leave without learning about the company or getting in touch.

Purpose.

This proposal redesigns the website with a Databricks-inspired look, content curated against the client's competitors, and one contact form page in place of the live website agent. It reviews the current site, uses recent research (2021 to present) to guide design choices, and tests a prototype with real users to confirm it is easier and more pleasant to use.

Client Goals and Discovery Findings

The questionnaire and the project lead's direction point to a bold, visual, Databricks-inspired site that builds trust with SME owners and managers, and they raise five tensions the design has to resolve.

Topic	**Answer or direction**	**What it means for the design**
Direction from the project lead	Look like Databricks if possible; curate the content accordingly and follow the competitors; build just a contact form page; no live website agent, because it consumes compute and tokens	Adopt Databricks-style structure and polish with Omnitron's own identity, benchmark the four competitors, and retire the assistant
Why redesign	Not a traditional SaaS look; visual first; should feel like a site made in 2030	Lead with imagery, motion, and bold layout in a Databricks-inspired style, while keeping pages light enough to load fast
Site goals	Build credibility and trust; attract enterprise clients	Trust signals and an enterprise-ready tone on every key page
Main buyer	SME owners and managers	Plain language and one clear next step

One site or two	One site with clearly separated sections (AI Solutions; Intelligence & Advisory covering cyber, fraud, PQC)	Distinct sections under one brand and one navigation
Brand assets	Partly defined	Complete the missing colors, type, and spacing in a small design system
Current technical "system" style	Not sure whether to keep it	Test both directions with users before committing
Proof available	None yet	Design slots for proof and plan how to collect it
Content to keep	Concepts must stay, since most people do not understand AI systems	Explain concepts visually and in plain words
Call to action	Contact form	One contact form page, linked from the main navigation and repeated at the end of key pages
Must include	Careers; multiple languages	A careers page and a language switcher; layouts that handle longer text
Competitors	IBM Consulting, Capital Numbers, Pegasus One, Oxagile	Benchmark set for the audit (see Benchmark section)
Admired website	Databricks	Primary visual reference, confirmed by the project lead's direction

Platform	Site on Vercel; the "Michelle" assistant runs on Railway	Keep the site on Vercel; retire the "Michelle" assistant, which consumes compute and tokens

Tensions to resolve

- ☐ **Databricks look vs Omnitron's own identity.** Borrowing structure and clarity from Databricks helps, but copying its look would blur Omnitron's own brand, which is only partly defined. Databricks is also a platform company with a product-led site, which sits next to the questionnaire's wish to avoid a traditional SaaS look, so the team should decide which Databricks traits to adopt.
- ☐ **Visual-first vs fast.** Rich visuals add weight, so the performance target (90 or higher on mobile) needs a clear budget for images, motion, and fonts.
- ☐ **SME buyers vs enterprise goal.** The main buyer is the SME, but the goal is to attract enterprise clients, so the homepage message has to be chosen carefully.
- ☐ **Credibility goal with no proof yet.** Without case studies, logos, or testimonials, trust has to come from clarity and design until proof exists.
- ☐ **Multiple languages.** Translated text is often longer, and the current site already loads 11 font files, so the type system needs to stay small.
